# **Economic Forecast for 2013**

The United States, Indiana, and Southeast Indiana

MICHAEL J. HICKS, PH.D. Ball State University Director, Center for Business and Economic Research Associate Professor of Economics, Miller College of Business

# THE US ECONOMY

The American economy faces steep and continuing difficulty in its path to recovery. Employment as a share of total population has been static or declining throughout 2012. With unemployment rates continuing to hover around 8 percent, there is mounting evidence that structural unemployment (a skills mismatch) plays a larger role in soft labor markets than previously believed. Moreover, Europe remains in recession, with unemployment rates at 50-year highs, while slow growth in BRIC nations suggest that much of the world shares our economic virus. These difficulties are magnified by the deepest policy uncertainty in decades. Lack of reasonable insight on such basic factors as tax rates in the coming days can only act to disincentive domestic investment and employment. This is a difficult landscape for the national economy.

For these reasons, our models suggest that unemployment rates will remain roughly where they are now throughout the coming year, with any relief in rates coming primarily from a dwindling labor force, not job creation. Real GDP growth will average 2 percent, roughly the rate of productivity growth. Inflation will not be an issue this year, nor will there be significant changes to borrowing costs.

A national recession remains highly likely this year. Though economic models have performed poorly in capturing economic turning points, either the composition of the 'fiscal cliff' or a sustained European recession alone are significant enough to push our economy into recession.

Over the long run (through 2025), we expect more of the same. We anticipate GDP growth will remain at roughly 2.5 percent and employment growth at less than 1 percent over this horizon.

### GOING OVER THE FISCAL CLIFF

A tax increase and spending cut similar to the current fiscal cliff debate will lead us into a recession. Nominal GDP will drop to the negative range in 2013, and remain a full point behind the long-term level through 2017 (or fiscal cliff model horizon). Employment will decline, and then rebound, remaining sluggish under either scenario through the forecast horizon.

...Either the composition of the 'fiscal cliff' or a sustained European recession alone are significant enough to push our economy into recession.

# THE HOOSIER ECONOMY

Indiana's economy has outperformed the nation as a whole in GDP growth and employment growth over this recession. However, our model suggests a mixed future. Overall economic activity in Indiana will continue to exceed the national average through much of this decade, slowing somewhat between 2018 and 2025. During this time period, employment growth will lag the nation as a whole. The explanations for this are fairly straightforward. First, labor force constraints will limit labor-intensive business expansion. Slower population growth is the most visible sign of this problem, but it is a nuanced concern, involving both the attractiveness of many of the state's regions to workers and the overall human capital levels in the state. Second, the state's most intensive industries are those that continue to experience high levels of productivity growth, thus dampening demand for workers.

#### THE SHORT-TERM OUTLOOK

In the short run, we expect a decline in personal income in durable goods manufacturing, retail, transportation, information and finance, insurance, and real estate sectors. We expect growth in mining and utilities, construction, health care, and non-durable goods manufacturing. Overall we expect personal income growth of 2.4 percent next year, followed by growth of 2.1 percent in 2014. Unemployment in the state will remain sticky, with an

average annual rate of 7.8 percent and a lower rate of 7.2 percent in 2014. However, the same cautionary tales regarding Europe, BRIC nations, and the fiscal cliff apply.

Indiana is a significant exporter of goods to the European Union, with more than 2 percent of GDP destined for Europe. Their recession will reduce demand for these goods and demand for employment in these firms. The slow growth in China and India add to lower demand for our goods.

Indiana is susceptible to major shocks with both spending cuts and tax increases. Domestic and defense spending cuts will likely affect services for the poor and public infrastructure grant programs. Likewise, defense spending may well impact the state, with the potential for significant cutbacks at U.S. Navy and joint training centers in southern and southwestern Indiana. Also, cessation of planned acquisition of aircraft, ground weapons systems, and electronics may also impact civilian employment in many businesses within the state.

The Indiana economy in 2013 will, at best, look much like it does today, with roughly 8 percent of Hoosiers unemployed and little or no prospects for rapid economic growth.

TABLE 1. STATE SHORT-RUN FORECAST

Industry	2013	2014
Mining	5.5%	5.9%
Construction	4.5%	5.1%
Durable goods manufacturing	-4.4%	-5.0%
Non durable goods manufacturing	2.5%	2.4%
Retail	-0.5%	-1.0%
Utilities	4.5%	4.7%
Wholesale	1.1%	0.9%
Transportation	-1.5%	-2.9%
Health care	4.7%	4.7%
Information services	-0.8%	-1.3%
Finance, insurance, and real estate	-1.3%	-2.1%
Total personal income	2.4%	2.1%
Unemployment rate	7.8%	7.2%

# SOUTHEASTERN INDIANA

Southeastern Indiana is an unusually heterogeneous region, possessing elements of all the disparate economic stories of the Midwest. Not surprisingly, the forecast for this region ranges widely from rapid growth to continuing struggles with outmigration and job loss.

Overall, we expect the region to see population growth significantly exceeding the state as a whole through 2025. This is important because population growth is a bellwether indicator of overall economic performance. Moreover, population growth will accelerate over the forecast horizon, with faster growth occurring in the 2019–2025 period than the earlier forecasted period.

Not surprisingly, the largest growth will be concentrated near the Cincinnati and Indianapolis metropolitan areas. However, growth in the more centrally located areas of Jennings, Ripley, and Jefferson counties will be unusually strong for non-metropolitan areas. Our models predict continued population shrinkage for both Rush and Fayette counties, continuing a trend that has slowed economic growth in the northern portion of this region.

Ohio and Switzerland counties will also grow, but face continued risk to major sectors of their economy as the state of Ohio continues to discuss placement and development of casino and gaming operations. The I-74 corridor and I-65 corridor will see more economic growth than the I-70 region through our forecast horizon. This is primarily due to the proximity of larger metropolitan areas at either end of theses interstate legs. Throughout the region, we anticipate small but sustained growths in personal income, and growth in manufacturing output for both consumer durables and non-durables, utilities, and construction.

Major threats to the region are weakness in the available and the appropriate labor force in some communities, changes to the structure of casino gaming (for southern counties) and national economic conditions.

Please see the next page for figures 2 and 3.
